

Anatomy of an Elbow

Thursday, May 12, 2016
1:15 PM

An elbow is a specific, standard, engineered bend pre-fabricated as a spool piece and designed to either be screwed, flanged, or welded to the piping it is associated with. An elbow can be 45 degree or 90 degree. There can also be custom-designed elbow, although most are categorized as either "short radius" or "long radius".
